WEEK 2: TELECOM

Mobile Device Metrics Report

Based on the Mobile Device Metrics Dashboard

Size: 700 users

Date: 5 November 2026

Purpose

A mobile technology company wants to understand how people use their ph ones so it can segment users and guide product design, battery optimization and marketing. This report summarizes what the dashboard shows.

Headline metrics

Total users	Avg battery drain	Avg data usage	Avg screen-on time	Heavy-user share
700	1,525 mAh/day	930 MB/day	5 hrs/day	39.3%

Heavy users are those in behavior classes 4 and 5 (275 of 700 users).

Key findings

1. The behavior class measures usage intensity. Every measure rises steadily from class 1 to class 5.

Class	Users	Screen-on (hrs/day)	Battery drain (mAh/day)	Data (MB/day)	Apps i nstalled
1	136	1	455	202	15
2	146	3	884	451	31
3	143	5	1,515	822	50
4	139	7	2,106	1,232	70
5	136	10	2,701	1,975	89

Battery drain grows almost sixfold and data usage nearly tenfold between the lightest and heaviest class. The dataset does not define the class, so this reading is inferred from the data.

2. The segments are evenly sized. Each class holds 19% to 21% of users, so no single segment dominates.

3. Demographics do not define the classes. The gender and operating system mix is similar in every class: iOS accounts for 16% to 23% of users in each, and class 3 is only slightly more female (57%). Average data usage differs little across age groups (909 to 958 MB/day). Behavior, not who the user is, separates the segments.

4. Device model matters little. Average screen-on time is about 5 hours on every model. Battery drain ranges from 1,476 mAh (Google Pixel 5) to 1,590 mAh (iPhone 12), a gap of under 8%.

Recommendations

- **Battery optimization: prioritize classes 4 and 5. Their drain of 2,106 to 2,701 mAh/day is 40% to 80% above the 1,525 mAh average, and they make up 39.3% of users.**
- **Product design: heavy users run 70 to 89 apps and use about 1.2 to 2.0 GB of data a day. Design for sustained load with efficient power management and larger batteries or faster charging.**
- **Marketing: target by class, not by gender, OS or age. Classes 1 and 2 (about 40% of users) suit entry-level plans, while classes 4 and 5 suit premium data plans and power accessories.**
- **Device focus: no model needs special treatment, since the differences between models are small.**

Limitations

The class definition is not documented, and the data is a snapshot, so it shows association rather than cause. Some rows show app usage time above screen-on

time; these were flagged but not altered. The data has no time-of-day or app-category detail.

The dataset has no price, region or purchase data, so it cannot explain why Android has more users than iOS.
